Job Safety Training Outline

Built to align with DAFI 91-202 paragraph 14.1 requirements.

Unit: AFAC HQ

Work Center: All work areas

Office Symbol: Not entered

Supervisor: John Crow

Phone: 565-0594

Reviewer: John Crow

Review Date: 2026-04-30

Effective Date: 2026-04-30

WORK CENTER OVERVIEW

All offices within building 491 and 1040 on JBSA Randolph.

REQUIRED TRAINING TOPICS

Workplace Hazards | Personal Protective Equipment | Emergency Action and Fire Prevention | Reporting Unsafe Conditions | Reporting Mishaps and Occupational Injury/Illness | CA-10 and LS-201 | DAF Traffic Safety Program | DAFVA 91-209 | DAFSMS Responsibilities

- **Hazards and controls:** Address task hazards, environmental hazards, governing instructions, and hierarchy of controls including elimination, engineering, substitution, and administrative controls.
- **PPE:** Cover required protective equipment, wear/use procedures, cleaning, maintenance, storage, disposal, and supervisor notification concerns.
- **Emergency response:** Cover emergency action, fire prevention, alarms, AEDs, extinguishers, evacuation, shelter, active shooter response, and emergency contact procedures.
- **Reporting:** Explain unsafe condition reporting, injury/illness reporting, DAF Form 457, SAFEREP access, and anti-retaliation protections.
- **Program awareness:** Include CA-10 / LS-201 location, traffic safety program requirements, DAFVA 91-209 location, and DAFSMS responsibilities.

Hierarchy of Controls

Apply these controls from most effective to least effective when reducing workplace hazards under DAFI 91-202 paragraph 14.1.2.1.4.

Use the highest level of control feasible first. PPE should protect workers only after elimination, substitution, engineering, and administrative controls have been considered.

Active Shooter Response

In the event of an active shooter, individuals should employ the **Avoid, Deny, Defend** response method. This strategy is adaptable to the specific situation and environment.

Avoid (Run): The first and preferred course of action is to evacuate the area if a safe route is available. Maintain awareness of your surroundings and have an escape route planned. Leave your belongings, evacuate regardless of whether others follow, and do not attempt to move wounded people. Once you have reached a safe location, call 911 and provide any information you have.

Deny (Hide): If you cannot evacuate, your next priority is to deny the attacker access to your location. This involves more than just hiding; it means securing your position. Lock and blockade doors with heavy furniture, turn off lights, silence your phone, and remain out of the shooter's view. Remember that concealment only hides you, while cover can offer protection from bullets.

Defend (Fight): As a last resort, when your life is in immediate danger, you must be prepared to defend yourself. Act aggressively and take action against the shooter. Improvise weapons from your surroundings and commit to your actions. Taking action may be risky, but it could be your best or only chance for survival.

When law enforcement arrives: Remain calm, follow all instructions, keep your hands visible with fingers spread, and be prepared to provide information about the shooter's location, number, and description.

DAFSMS FRAMEWORK

DAFSMS uses four pillars and the DAFSMS framework to structure the mishap prevention program through continuous improvement and the Plan-Do-Check-Act model.

Policy and Leadership

Provides the structure for a proactive mishap prevention program through policy, active leadership engagement, and clearly defined responsibilities at every level.

Risk Management

Integrates hazard identification, assessment, and control decisions into daily operations to reduce mishaps and strengthen safety culture.

Assurance

Uses evaluations, monitoring, reviews, and data to confirm the mishap prevention program is implemented and improving over time.

Promotion, Education, and Training

Ensures Airmen and Guardians receive safety awareness information, embedded training, effective risk controls, and active engagement in mishap prevention.

1. Purpose. DAFSMS utilizes the four pillars and the DAFSMS framework to structure the mishap prevention program. Activities associated with each pillar set policy, identify and mitigate hazards and risk, and reduce the occurrence and cost of injuries, illnesses, fatalities, and property damage through continuous improvement and the PDCA model.

2. Policy and Leadership. Safety policy provides the structure for a sound and proactive mishap prevention program. Active leadership involvement in implementation and execution is critical at all levels of command.

3. Risk Management. Ensure the RM process is fully integrated into all safety-related activities to enhance mishap prevention and sustain a proactive safety culture. Refer to DAFI 90-802 and DAFPAM 90-803 for additional detail.

4. Assurance. Safety assurance is how commanders determine whether mishap prevention elements are implemented and guides continuous improvement through evaluation, monitoring, and review.

5. Promotion, Education, and Training. Ensure Airmen and Guardians are provided safety awareness information, organizations have embedded ongoing training into the mishap prevention program, effective risk controls are implemented, and personnel remain actively engaged.

Report it on
SAFEREP
HAZARDS ARE EVERYWHERE.
SAFEREP
WHAT ARE YOU DOING TO
PREVENT INJURY OR DEATH?
More info about SAFEREP
www.safety.af.mil/home/saferep

SAFEREP is the Department of the Air Force's (DAF) premiere digital safety reporting tool and mobile app. It allows Airmen and Guardians to easily report hazardous conditions, near-misses, unintentional errors, or safety concerns across all disciplines, including workplace, traffic, industrial, flight, weapons, and space safety, directly from their devices anytime and anywhere.

Fully integrated with the Air Force Safety Automated System (AFSAS), it replaces the earlier Airman Safety App and serves as the DAF's only fully digital safety reporting avenue. Users simply answer a short series of questions to submit reports that reach the appropriate Major Command (MAJCOM) safety office quickly and efficiently.

Key Benefits for Job Safety Training:

- **Empowers everyone:** Turns every Airman or Guardian into a proactive sensor for hazard identification, encouraging a strong safety culture where people feel comfortable speaking up without barriers like paperwork or word-of-mouth delays.
- **Prevents mishaps:** Enables early mitigation of risks before they lead to incidents, capturing minor events and near-misses that offer the greatest prevention potential.
- **Simple and accessible:** Mobile-first design makes reporting fast, more efficient than traditional methods, and available on the spot through the app on Google Play and the Apple App Store.
- **Broad coverage and integration:** Supports multiple safety areas and includes specialized features such as Aviation Safety Action Program reporting, improving visibility, tracking, and overall risk management across the force.

This tool strengthens operational readiness by fostering a proactive, data-driven approach to safety. You can download it from the app stores or access it through the official SAFEREP site for more details.

REPORTING UNSAFE EQUIPMENT, CONDITIONS, OR PROCEDURES

Employees must report unsafe equipment, conditions, or procedures to their supervisor immediately. This includes any hazard that could injure personnel, damage equipment, or create an unsafe work process.

Personnel must also be notified that unsafe conditions, work-related injuries, and illnesses may be reported **without fear of retaliation**. Immediate supervisor involvement remains the primary reporting path, with SAFEREP and formal hazard-report channels available when needed.

What To Report

- Unsafe equipment that is broken, damaged, unserviceable, or missing required guards or controls.
- Unsafe conditions or procedures that create a hazard to personnel, operations, or facilities.
- Work-related injuries, illnesses, near-misses, and hazards needing immediate attention.

Immediate Actions

- Notify the supervisor or responsible area lead immediately.
- If the hazard can be safely controlled, stop use and isolate the equipment or area until corrected.
- If the danger is imminent to life or health, evacuate the area and activate emergency response procedures.

Tag use examples: Use the appropriate danger, caution, out-of-order, or do-not-start tag to keep unsafe equipment out of service until the hazard has been corrected and the responsible supervisor authorizes return to use.

Escalation: If the issue cannot be resolved at the lowest level, elevate it through the unit safety representative, DAF Form 457 process, or SAFEREP as appropriate.

USE OF PORTABLE FIRE EXTINGUISHERS

Portable fire extinguishers are intended for small, incipient-stage fires only. Personnel should use an extinguisher only when they have been trained, the fire is small and contained, the correct extinguisher is available, and there is a clear evacuation path behind them.

Use the **PASS** method when operating a portable fire extinguisher: **Pull** the pin, **Aim** at the base of the fire, **Squeeze** the handle, and **Sweep** side to side.

If the fire grows, smoke conditions worsen, or the extinguisher does not control the fire immediately, evacuate the area, activate the local emergency response process, and report the incident to emergency services and supervision.

WORK AREA HAZARD ANALYSIS

Potential risks identified by a Work Area Hazard Analysis reveal primarily ergonomic strains, slips/trips/falls, and electrical hazards to prevent injuries. Key actions include assessing workstation

ergonomics, maintaining clear walkways, securing cables, inspecting equipment for damage, and ensuring proper storage to prevent falling objects.

RISK MANAGEMENT FUNDAMENTALS

Reference: DAFSMS and local RM program guidance.

Address hazard identification, control selection, local escalation expectations, and when RM refresher training must be completed for this work center.

Risk Management Fundamentals training can be conducted at https://usaf.percipio.com/

JOB-SPECIFIC A LA CARTE MODULES

Government Vehicle / Utility Vehicle Use **Manual Lifting and Material Handling**

Fire Protection and Prevention **Office Safety**

- **Government Vehicle / Utility Vehicle Use:** Document local licensing, route restrictions, spotter use, rollover protection, and unit-specific operating rules. OSHA 2254 does not provide a direct GOV/UTV training excerpt here. Local GOV, GVO, or UTV operating rules and licensing expectations
- **Manual Lifting and Material Handling:** Supervisors must ensure thorough training on proper manual lifting techniques, required PPE, and the use of manual lifting devices. Training must use both verbal and written materials, include practice on proper motions, and be documented under DAFI 91-202. Cover shop-specific lifting limits, two-person lift triggers, hand truck and lifting-device use, and when supervisors require assisted handling. No direct OSHA 2254 standalone manual-lifting module is mapped here. Manual lifting techniques and available lifting devices
- **Fire Protection and Prevention:**
- **Office Safety:** Common office safety hazards include slips, trips, and falls from wet floors or cables, and ergonomic injuries from improper workstation setups. Other hazards involve improper equipment use, falling objects, electrical hazards, lifting heavy objects overhead and could include environmental factors like poor air quality. Common injuries include strains, cuts, and bruises. Slips, Trips, and Falls are the most common office injury usually from wet floors, loose rugs, electrical cords crossing walkways, and broken stairs. Slips, trips, and falls also occur outside the office in parking lots not properly maintained or from snow and ice. Ergonomic hazards occur from poorly adjusted chairs, keyboards, or monitors causing musculoskeletal disorders (back pain, carpal tunnel). Physical or object hazards can occur from Improperly stacked files falling, open desk drawers, or lifting heavy objects incorrectly. Electrical hazards exist from frayed cords, overloaded power strips, and daisy-chained extension cords, which pose fire risks. Improper use of paper cutters, sharp scissors, or malfunctioning chair wheels has cause reportable injury to AFRS members. Environmental hazards are caused by poor ventilation, lack of fresh air, dust, or mold, which can lead to illnesses.

DAFI 90-821, HAZARD COMMUNICATION (HAZCOM) PROGRAM

REQUIRED DOCUMENTS

- CA-10
  What a Federal Employee Should Do When Injured at Work. Use this as the workplace reference for employee injury reporting and follow-up actions.
- DAF Form 457
  Hazard Report. Use this form to identify, document, and elevate unsafe conditions, equipment, or procedures in the workplace.
- DAFVA 91-209 **UNITS MUST FILL IN THEIR OWN DAFVA 91-209 POSTING/LOCATION INFORMATION.**
  Department of the Air Force Occupational Safety and Health Program visual aid. Keep this available so personnel know the core safety rights, responsibilities, and reporting expectations.
- LS-201
  Notice of Employee's Injury or Death (Non-Appropriated Funds). Use this when applicable for NAF employee injury or death reporting.

DAF TRAFFIC SAFETY PROGRAM

Reference: DAFI 91-207. Requirements of the DAF traffic safety program include mandatory use of seat belts and helmets, speed limits, local traffic hazards, spotters while backing, and vehicle training requirements.
Additionally, brief prohibition or restrictions on electronic-device use while operating vehicles on- or off-base, and discuss motorcycle safety training requirements before riding a motorcycle.

On-Base / Vehicle Operations

- Obey posted speed limits, traffic control devices, and local roadway rules.
- Use installed seat belts and occupant restraints as designed by the manufacturer.
- Use spotters while backing when required by local policy, task conditions, or vehicle type.
- Complete required GOV, GVO, golf cart, low-speed vehicle, or mission-specific vehicle training before operation.

Electronic Devices / Headphones

- Do not use non-hands-free electronic devices while operating a motor vehicle.
- Stop in a safe location before using a phone if hands-free operation is not available.
- Do not wear headphones or listening devices in ways that interfere with hearing traffic, alarms, or emergency warnings.

Motorcycle / ATV Safety

- Complete required motorcycle rider training before riding on a roadway.
- Wear required PPE including helmet, eye protection, gloves, protective clothing, and over-the-ankle footwear.
- Carry proof of required training when applicable and comply with state licensing requirements.

Pedestrian / Bicycle Awareness

- Use caution at crossings, follow traffic controls, and wear visibility gear when exposed to roadway hazards.
- Use required lighting and reflective equipment during darkness, reduced visibility, or inclement weather.

Local Traffic Hazards / Vehicle Notes:
The highway system in San Antonio is laid out in a wagon wheel configuration and has many bridges/fly-overs/overpasses. In inclement weather, these, along with many others, become very slick. When raining, the oil and petroleum rise to the surface causing the roads to become very slick. Flooding occurs quickly in the local area check rain before entering a low water crossing and never go around road barricades. Freezing temperatures combined with moisture will cause the bridges/fly- overs/overpasses to freeze very quickly. Avoid those areas if possible during freezing weather. Construction is on-going throughout the city. Be aware that traffic flow and lanes can change from one day to the next. Reduce your speed in these areas.

SSgt Liz Hemmer

No GVO risk assessment files uploaded.

EMERGENCY INFORMATION

- **Emergency Numbers:**
  911
  Note: If using a cell phone to dial 911, you will be connected to an off base dispatch center and not the Randolph Fire Emergency Services dispatch center. Inform the operator the emergency is on Randolph and you will then be transferred back to base.
- **Medical Facility / Treatment:**
  On-duty military and civilian personnel have the option to be seen on base at the Randolph clinic. However, on-duty civilians also have the option to be seen off base at their preferred doctor.

- **Evacuation / Muster Point:**
  Evacuation routes are posted next to numerous exits around the facility. Become familiar with the routes.
- **Shelter in Place:**
  Shelter In Place ensures organized safety with accountability in mind. During a Shelter In Place situation while in AFRS, please do not leave Bldg. 491. Unless otherwise advised (due to the nature of the emergency), we would rally in the basement in the ECR - since this area has the capacity to hold AFRS.
- **Active Shooter Response Methods:**
  Not entered
- **Adverse Weather Shelter:**
  Not entered

No evacuation route image uploaded.

EMERGENCY EQUIPMENT AND SAFETY BOARD

Safety Bulletin Board Location: Your safety bulletin board is located: Main Lobby, RSO hallway (just outside double glass doors).

1st Floor Bldg 491: Pull boxes located just inside the double doors located in center of the building.
Marketing Hallway: East end of hallway across from Rm 136. Operations Hallway: West end of hallway adjacent to Rm 106.
Basement: located at the base of the stairs and just to the left of the entryway into the ECR.
2nd Floor: West end of hallway adjacent to Rm 201.
East end of hallway located on North side of bldg just before the Command Section.
North side of bldg hallway located on east end just before Command Section.

No emergency equipment maps or photos uploaded.

DOCUMENTATION AND REVIEW

Supervisors will provide and document safety training to all newly assigned individuals (i.e., PCS, PCA or work center change to include deployment) on the hazards of their job before they start work and immediately when there is a change. Training will be documented on DAF form 55 or unit electronic safety training tracker.

No DAF Form 1118 files uploaded.

No Bioenvironmental Workplace Survey uploaded.
