

Job Safety Training Outline

Built to align with DAFI 91-202 paragraph 14.1 requirements.

Unit: 943 MXS

Work Center: Specialist Flight

Work Area / Office Symbol: MXAAS

Phone: 228-2325

Supervisor: SMSgt Paredes, Michelle

Reviewer: SMSgt Paredes, Michelle

Review Date: 2026-07-14

Effective Date: 2026-07-14

Work Center Overview

The Specialist Flight provides back-shop and on-aircraft maintenance for the HH-60 fleet, directly troubleshooting and repairing critical mission systems to ensure training and CSAR missions can be executed safely. They diagnose, repair, and maintain the following vital HH-60 systems: Avionics, EW, GAC, E&E, and Propulsion.

Work Area Hazard Analysis / JHA Notes

1. HAZARDS OF THE JOB THAT APPLY TO YOUR WORKPLACE:

OFFICE: Practice good housekeeping. Clean the office at the end of the day. Practice all safety rules and do not horseplay in the office. Use everything as the manufacture intended. Do not use chairs for ladders, or set heavy loads on shelves. Don't leave file cabinet drawers, desk drawers open or unevenly balanced; keep all legs of chairs on the floor. Do not position telephone, Ethernet or power cords across traffic lanes. If you need to move any cords previously mentioned, contact the units IT department for help. Always have computer connected to an Uninterrupted Power Supply. Do not plug a surge protector or power strip into an existing surge protector or UPS. This practice is called "daisy chaining" or "piggy backing" and can lead to serious problems. Never drink around computers because of the electrical hazards and potential damage costs if you spill fluids on the keyboards or components. Report all broken items to your supervisor or building manager.

Do not tape, staple, or tack extension cords to building surfaces. Extension cords shall not be spliced, coiled, or placed where they may be damaged or create a hazard. Cords will not be walked on nor will equipment be allowed to run over them. If cords must be placed in travel lanes, they will be protected by molded housings or bridges. Cords will not be kinked, stretched, or bent excessively. Practices of this nature will damage internal wire strands (AFMAN 91-203, Chapter 8).

Surge Protector/Power Strip/Extension cords:

- Use only as a temporary measure.
- They will not be placed in such a manner that will present a tripping hazard.
- Visually inspect all surge protectors or power strips on a regular basis.
- You must ensure the extension cord being used is rated for the capacity of the item or items to be plugged in.
- Use only surge protectors or power strips that have an internal circuit breaker. These units will trip the breaker if the power strip is overloaded or shorted to prevent overheating.
- Never plug medical equipment into a surge protector or power strip unless it is approved for this purpose.

Sharp objects: Paper cutters, scissors, razors, knives, etc., must be carefully handled to prevent injuries. Use razor knives with the type that allows the blade to be protected when not in use. Unprotected razor blades will not be used. Do not store these razors with the blade exposed. Keep fingers away from moving and/or sharp parts when using tools such as the following: staplers, hole-punchers, staple removers, paper cutters, scissors, and paper shredders.

ERGONOMICS: The position you put yourself in can be harmful. Prolonged crouching, bending or hanging upside down can lead to stiff and sore joints and muscles, becoming light headed, and even blood clots. Remember to take breaks when you need them and stay hydrated. Prolonged use of a typewriter, word processor or computer terminal can result in back discomfort. Keeping your back straight and maintaining a good posture can help in reducing the stress on the lower back. Taking a 10-minute break after typing for an hour can also reduce/prevent back pain and eye fatigue. Proper height adjustment of seats and adequate lighting are important preventive measures.

Office Ergonomics: Ergonomics attempt to adapt the job to fit the person, rather than forcing the person to fit the job. Adapting the job to better fit the worker can help reduce stress and eliminate many potential injuries and disorders associated with the overuse of muscles, bad posture and repetitive motion.

REPETITIVE MOTION HAZARDS: Repetitive tasks such as typing may create physical problems in some individuals. To avoid such problems, alternate your tasks to prevent the over-exertion of a particular body part or series of parts. Your job provides you the latitude to alternate tasks without

hindering mission effectiveness. Schedule your daily tasks with this in mind. Work performed at a video display terminal (VDT) may require a worker to sit for a long period of time and involves small frequent movements of the eyes, head, arms, and fingers. To sit at a fixed posture for a long period of time can cause muscle fatigue and can eventually lead to muscle pain and injury. VDT operators may also develop various musculoskeletal disorders such as carpal tunnel syndrome, and tendonitis.

OVER-EXERTION: Almost three-fourths of the strain or exertion mishaps occurred while workers were trying to carry or move objects such as Test Equipment, AGE, LRUs, Toolboxes, office machines, supplies, file cabinets, office furniture, heavy books, or other items. Proper lifting of heavy objects requires use of legs to lift the weight, not the back.

CLIMBING AND LIFTING: Know your limitations. Climbing, stooping, bending, reaching, stretching and working in tiring, uncomfortable positions are things we must contend with in order to perform certain tasks. Supervisors shall ensure their workers receive thorough instruction and training on proper manual lifting techniques both routine or high risk and any PPE required. When a heavy object must be moved, get help or utilize mechanical equipment to move it. Supervisors shall instruct workers on their use. Also, proper lifting procedures must be used when moving any material. Proper lifting procedures will be demonstrated to you. This training shall include both verbal and written materials that explain how to do the task correctly with practice and proper motions. Use only approved ladders, stands or scaffolds. Do not climb on or jump from makeshift items.

Material handling (bending, lifting, and twisting): Always use proper lifting techniques as learned in Manual Lifting training. Get help if you have any doubts on your ability to lift an object.

SLIPS/TRIPS AND FALL: Major causes of office injuries are slips, trips and falls. Falls can occur because of objects in the pathway. Some key factors to remember in preventing falls are:

- Always use handrails.
- Do not carry items stacked above eye level up or down stairs.
- Do not read while going up or down stairs.
- Make sure wheels on stands are locked and 90 deg. off from one another.
- Keep desk, file cabinets and other furniture doors closed when not in immediate use.
- Do not place electrical cords, air hoses, hydraulic lines, computer wires or phone lines across walking areas. Use rubber bridges if there is no other choice.
- Do not stand on any chair, desk or box, use a ladder.
- Do not leave objects like boxes, trashcans, pens and pencils, etc., in pathways.
- Spills - Clean up immediately. If you have to leave the area to get cleaning materials, identify the affected area by covering it with a chair or by posting a warning sign at the entrance to advise people of the hazard. Also post signs for freshly mopped and waxed floors.
- Ensure mats are placed at all exterior entrances to prevent wet floors.

SHIFT FATIGUE: Fatigue is a critical occupational safety concern for shift workers. Irregular working hours, monotonous work, long shifts, and prescription or some over the counter drugs increase drowsiness and reduce alertness. Sleep deprivation affects a person's carefulness and ability to respond to an emergency. Symptoms can include: decreased judgment, decision-making and memory; slower reaction time; lack of concentration; fixation; and a worsened mood. The environment and nature of the work can further magnify the effects of sleep debt. Environments with dim lighting, limited visual acuity (e.g. due to weather), high temperatures, and high noise tend to enhance fatigue. Also, a worker's susceptibility to fatigue is increased by tasks where attention must be sustained for a long period, and those which are long, repetitive, paced, difficult, boring and monotonous. Workers can reduce fatigue through proper nutrition, stress control and exercise. Regular exercise is important -- cardiovascular, muscle strengthening and flexibility. Employers can avoid placing workers in jeopardy by analyzing working conditions and addressing operational safety disincentives. Work rotation schedules that go in the direction of the sun (morning, afternoon, night) have been found to reduce the negative effects. Urge personnel traveling from out of town to carefully and intelligently plan the trip, allowing time for rest prior

to departure and at least every two hours while traveling. Supervisors should adjust the working schedule of travelers so that the drivers receive adequate rest before traveling long distances.

ATTENTIVENESS: Attentiveness is part of every task, but it is equally important to be aware of hazards of the work area even if you don't work in a particular area. Attention to detail and the task at hand are important concepts to any job and key components to the safety and well-being of personnel.

WEATHER: Work is required to be accomplished under all types of weather conditions. Surfaces of aircraft, stands, ladders, ramps and other walking surfaces are extremely slippery when wet or icy. Heat and sun exposure are also environmental hazards. Personnel must drink plenty of water when working in heat. Proper clothing must be worn in both cold and hot weather. During summer months, take frequent breaks and drink plenty of fluids. Be aware of symptoms of heat exhaustion and heat stroke. Be aware of lightning during the summer monsoon season. During periods of heavy rainfall, many roadways in the local area flood. Be aware of low water crossings and do not attempt to cross them. Avoid crossing any roadway where water has covered it. The water depth and current speed is deceiving.

HEAT EXHAUSTION: If you or a coworker experiences any of these symptoms the victim should rest in a cool place and drink water or an electrolyte solution. Severe cases involving victims who vomit or lose consciousness may require longer treatment under medical supervision. Heat stroke: body stops sweating, mental confusion, delirium, loss of consciousness, convulsions or coma, body temp of 106 degrees or higher, hot dry skin which may be red, mottled, or bluish. Seek medical attention for the victim immediately.

Heat stroke: Body stops sweating, mental confusion, delirium, loss of consciousness, convulsions or coma, body temperature of 106 degrees or higher, hot dry skin that may be red, mottled, or bluish. Seek medical attention for the victim immediately.

JEWELRY: During performance of duties in the office, wear of jewelry is not restricted. Jewelry will Not be worn while on the flight line, equipment and material handling, or other physical tasks. If there is any question as to whether jewelry should be worn, remove it until you can get your Supervisor's approval.

ELECTRICAL EQUIPMENT: Ensure all electrical equipment is properly grounded unless it is double insulated. Grounded plugs are the three-prong types and double insulated are the two-prong type. Do not by-pass the ground by using adapters or extension cords. Sometimes the plug on the equipment may have to be changed if a grounded adapter cannot be located. Improper grounding causes serious shocks and fires. Do not unplug by pulling on the cord. Frequently inspect cords for damage. If you feel a shock or tingling sensation when you touch a piece of equipment, turn it off at the power strip or circuit breaker (if possible) and report it to your supervisor.

TEST EQUIPMENT: Use Caution and ALWAYS follow Tech Data.

- Make sure that if you have your equipment grounded if needed.
- Make sure the 244 is signed off, and there is no defects.
- Make sure the equipment is properly warmed up if needed.

STORAGE: It is important to keep your workplace neat. To avoid the dangers of improper storage in the workplace, follow these guidelines:

- Do not stockpile office supplies. Over-abundance can make storage unsafe.
- Store flammable material in their proper containers and place in the Flammable Locker when material is not being used.
- Keep aisles clear; place item where they do not present a tripping hazard.

USE OF OTHER TOOLS/EQUIPMENT: There is an assortment of tools in the office that are available for use. Ensure all tools are used for the purpose they were designed. Inspect tools prior to use. Look for cracking, chipping, dull edges, undressed tools, or any other defect that could make a tool unsafe. If you discover an unsafe tool, remove it from service immediately and dispose of it properly or give it to your

supervisor.

LIGHTING: Poor lighting in the work area are a hazard that can occur at any time without forewarning. It can be caused by burned out or stroboscopic fluorescent lights, or a bad ballast in the light fixture. Prolonged exposure while reading or writing under poor lighting conditions that can result in unnecessary eyestrain. If a bad ballast causes the lighting problem, contact the building custodian to have a work order submitted to CES. If you are uncertain of the adequacy of the lighting in your work section contact the hospital Health Engineers for assistance.

VEHICLES: A valid state driver's license is required for driving government owned commercial design, general purpose vehicles of 1 1/2 ton cargo or 15 passengers or less. A military license will be required if an individual is on mobility and the job requires driving military vehicles in an overseas location. Observe vehicle speed limits on base and flight line. Be observant of other vehicles, pedestrians and obstacles. Obey all traffic safety rules. Seat belts are required while in a government vehicle or private vehicles on base. Use caution when towing equipment.

Vehicle Safety: Make certain that any vehicle that you operate is in a safe operating condition. Make sure the brakes, including the parking brake work. Also, check to make sure all lights, windshield wipers, and emission system work properly (no exhaust leaks). It is best not to drive off any paved surface unless absolutely necessary. If you must leave the paved surface, and need to enter an aircraft parking ramp, or taxiway, you must first inspect the vehicle for FOD. This is to include the tires, fender wells, and undercarriage.

Vehicle/Pedestrian Traffic: There are many crosswalks. As a pedestrian, use caution when crossing a roadway. Ensure you allow vehicle traffic adequate time to stop before entering into their path. As a vehicle operator, yield to pedestrian traffic. Pedestrians have the right-of-way when they are crossing at a marked crossing.

Vehicle Operations (Speed Limits): The speed limit on Davis-Monthan AFB is 30 MPH Unless otherwise posted. Yield to pedestrians when they are at a marked crosswalk.

EXCESSIVE NOISE: Numerous field environment duties require exposure to excessive noise level, such as weapons fire, (during weapon qualification) aircraft engines and support equipment. Always ensure proper ear protection is worn when performing duties around these noise-producing hazards to prevent a hearing injury. Always use double hearing protection on the flightline.

DESIGNATED SMOKING AREAS: There is no smoking allowed in the building. Use designated smoking areas for tobacco use.

EXPLOSIVE HAZARDS: Work centers have unique explosives hazards based on type of explosives they are exposed to in the work area.

2. REQUIRED USE OF PPE:

Person Protective Equipment (PPE). Reference: 29 CFR 1910.132, AFMAN 91-203 Chapter 14 and other applicable directives.

*See Block I and II on FORM 55 (if used) for issued/provided protective equipment items.

Personal protective equipment (PPE) is designed to protect the worker against biological, chemical, or physical hazards associated with the work environment. Normally, employees do not have a need for PPE in an office setting. However, there may be occasions when PPE may be necessary during some

non-routine activities. Examples are moving furniture, painting or other minor cosmetic construction/facility up-keep, and other miscellaneous details. Consider what specific items and uses you may need PPE for in your area.

- **Foot Protection:**

Safety toe shoes - performing any maintenance and/or moving heavy equipment.

- **Arm/Hand Protection:**

Leather Safety Gloves - Pallet build-up/tear-down, moving heavy equipment, tying down heavy equipment for shipment, crating/uncrating equipment in wooden/fiberglass containers.

- **Nitrile, butyl, Chemical/Oil Resistant Gloves - Hazardous material or waste handling**

- **Eye Protection:**

Face shield, safety glasses – soldering operations, compressed air/gasses, grinder/drill use, and safety wire operations, hammering, painting and using a punch or chisel, procedures involving Hydraulic Oil/Dielectric Coolant

Face shields will only be used as secondary eye and face protection in areas where splashing, rather than hazardous impact, is the problem. In the case of primary protection, other protective devices, such as safety goggles will be worn. (OSHA 29 CFR 1910.133)

- **Hearing Protection:**

Ear plugs, ear defenders - Use as needed. We currently are not required to wear ear protection in the shop. However, both ear plugs and ear defenders are mandatory when performing maintenance on the flightline.

- **Other:**

Reflective Belts/Vests - Flightline maintenance during the hours of darkness, and during operation of bicycle/motorcycle

Personnel who wear contact lens or have medical conditions or take medications that may affect the use or wear of PPE must notify their supervisor immediately

Required Training Topics

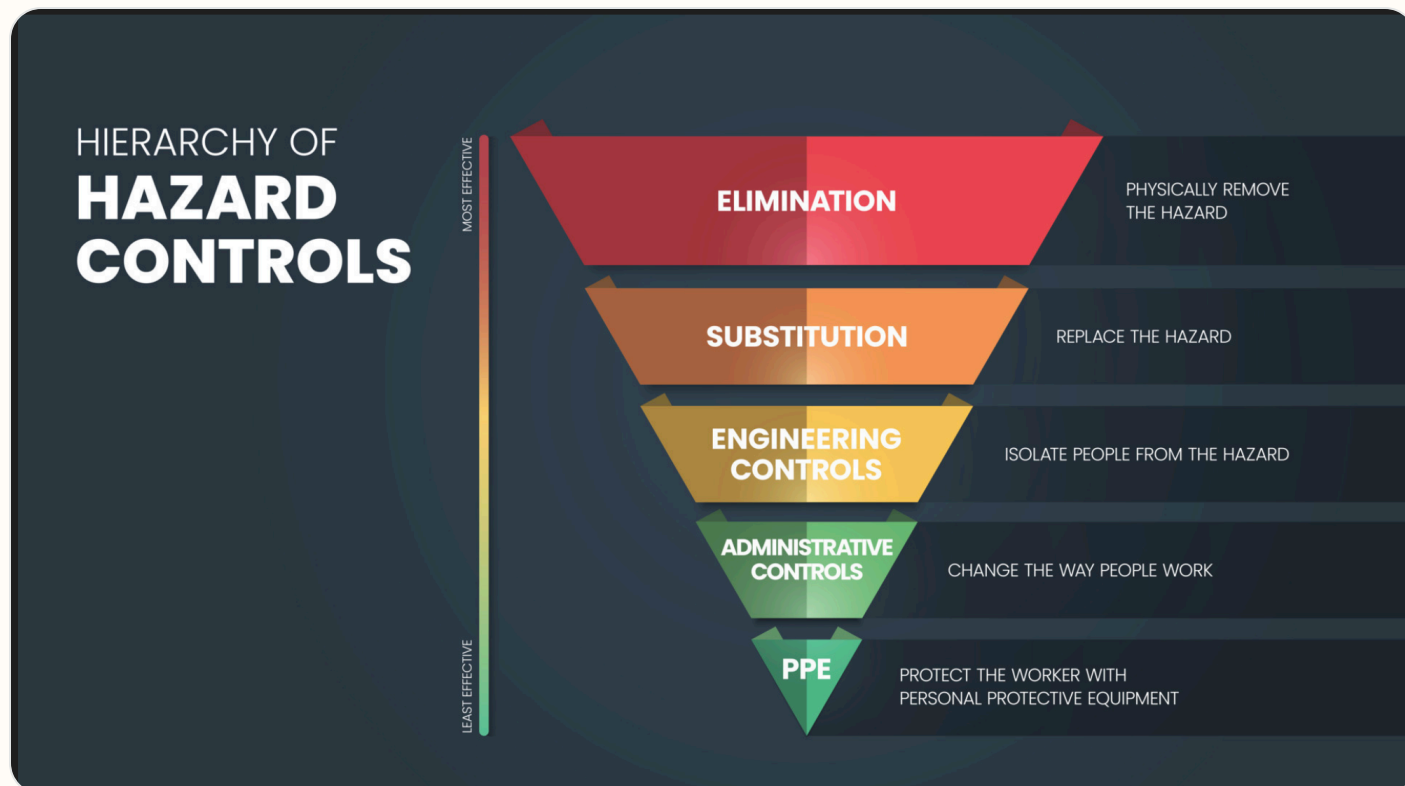

Workplace Hazards Personal Protective Equipment Emergency Action and Fire Prevention Reporting Unsafe Equipment, Conditions, or Procedures Mishap, Occupational Injury, and Illness Reporting CA-10 and LS-201 DAF Traffic Safety Program DAFVA 91-209 Location and Content DAFSMS Responsibilities

- **Workplace hazards:** Describe crushing, burn, chemical, ladder, weather, flight line, and noise hazards specific to the work center, plus the technical orders, JHAs, and instructions workers must follow.
- **Personal protective equipment:** Train employees on required PPE, including donning, doffing, cleaning, maintenance, storage, disposal, and reporting contact-lens or medical issues that could affect wear.
- **Emergency action and fire prevention:** Cover alarms, AEDs, extinguishers, evacuation routes, shelter locations, and response procedures tied to the work center.
- **Reporting unsafe conditions:** Instruct personnel to report unsafe equipment, conditions, procedures, and injuries without fear of reprisal, including use of DAF Form 457 and applicable reporting channels.
- **Mishap / injury / illness reporting:** Explain on-duty and off-duty reporting requirements, medical treatment procedures, and emergency response contacts.
- **Traffic safety:** Brief seat belt, speed limit, spotter, electronic device, and motorcycle safety requirements applicable to the work center.

- **DAFVA 91-209 and DAFSMS:** Review the location of DAFVA 91-209 and how workers contribute to the unit safety management system.

Hierarchy of Controls

Apply these controls from most effective to least effective when reducing workplace hazards under DAFI 91-202 paragraph 14.1.2.1.4.

Use the highest level of control feasible first. PPE should protect workers only after elimination, substitution, engineering, and administrative controls have been considered.

Active Shooter Response

In the event of an active shooter, individuals should employ the **Avoid, Deny, Defend** response method. This strategy is adaptable to the specific situation and environment.

Responses to an Active Shooter include:

Avoid (RUN),

Deny (HIDE),

Defend (FIGHT)

Adapt your response to the weapons used:

Ricocheting bullets

Shrapnel and secondary missiles

Cover vs Concealment

An active shooter situation may be over within 15 minutes, before law enforcement arrives.

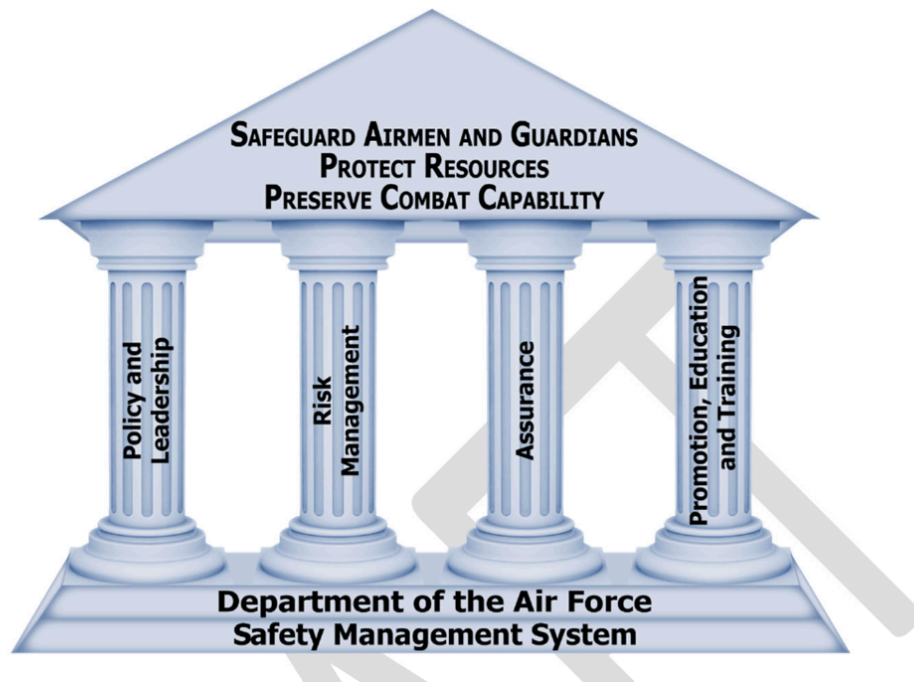

Avoid (Run): The first and preferred course of action is to evacuate the area if a safe route is available. Maintain awareness of your surroundings and have an escape route planned. Leave your belongings, evacuate regardless of whether others follow, and do not attempt to move wounded people. Once you have reached a safe location, call 911 and provide any information you have.

Deny (Hide): If you cannot evacuate, your next priority is to deny the attacker access to your location. This involves more than just hiding; it means securing your position. Lock and blockade doors with heavy furniture, turn off lights, silence your phone, and remain out of the shooter's view. Remember that concealment only hides you, while cover can offer protection from bullets.

Defend (Fight): As a last resort, when your life is in immediate danger, you must be prepared to defend yourself. Act aggressively, improvise weapons from your surroundings, and commit fully to your actions. Taking action may be risky, but it could be your best or only chance for survival.

When law enforcement arrives: Remain calm, follow all instructions, keep your hands visible with fingers spread, and be prepared to provide information about the shooter's location, number, and description.

DAFSMS uses four pillars and the DAFSMS framework to structure the mishap prevention program through continuous improvement and the Plan-Do-Check-Act model.

Policy and Leadership

Safety policy provides the structure for a proactive mishap prevention program. Active leadership involvement at every level is critical to implementation and sustained execution.

Risk Management

Integrate risk management into all safety-related activities so hazards are identified early, controls are implemented, and the safety culture stays proactive.

Assurance

Use evaluations, monitoring, and review processes to measure conformance to standards and drive continuous improvement across the mishap prevention program.

Promotion, Education, and Training

Provide safety awareness, embed ongoing training, implement effective controls, and keep airmen and guardians actively engaged in mishap prevention.

Department of the Air Force SMS Framework

Policy and Leadership

- Leadership planning, organization, direction, and control
- Management roles, responsibilities, and relationships
- Procedures and controls that are developed, documented, maintained, and monitored
- Safety and quality balance, integration, and goal setting

Risk Management

- Hazard identification through mission/task analysis and hazard lists
- Hazard assessment using exposure, probability, severity, and risk level
- Control options, effects, prioritization, selection, and decisions
- Implementation, communication, accountability, support, supervision, and feedback

Assurance

- Performance requirements, expectations, and control effectiveness
- Continuous monitoring, self-inspections, internal and external inspections
- Mishap and event investigation, reporting, metrics, and improvement opportunities
- Change management and continuous improvement actions

Promotion, Education, and Training

- Culture built on informed, flexible, learning, just, and reporting behaviors
- Competency through training and education
- Awareness through internal communication, external communication, and information access

Job Specific Training Items

No job-specific modules selected yet.

No modules selected

Required Documents

- [CA-10](#)
What a Federal Employee Should Do When Injured at Work. Use this as the workplace reference for employee injury reporting and follow-up actions.
- [DAF Form 457](#)
Hazard Report. Use this form to identify, document, and elevate unsafe conditions, equipment, or procedures in the workplace.
- [DAFVA 91-209](#) **UNITS MUST FILL OUT THEIR OWN LOCATION POSTED**
Department of the Air Force Occupational Safety and Health Program visual aid. Keep this available so personnel know the core safety rights, responsibilities, and reporting expectations.
Location Posted: Posted on the Squadron's Safety Bulletin Boards: Bldg 1750 first floor main

hallway and room 138 along the North wall. Bldg 1632 in the engine maintenance bay along the West wall.

- [LS-201](#)

Notice of Employee's Injury or Death (Non-Appropriated Funds). Use this when applicable for NAF employee injury or death reporting.

Emergency Information

- **Emergency Numbers:** Fire Dept: 911 / 228-3333 / Non-ER 228-4757;
Security Forces Non-ER: 228-3200;
Command Post: 228-7400;
Base Ops: 228-4315 / 228-4507;
943 MXS MOC: 228-2353;
Public Health: 228-2714;
943 RQG Safety: 228-2329 / 228-1608;
355th Wing Safety: 228-3311 / Cell 520-909-0316;

If the base 911 telephone system is down (228-3333), report fire or medical emergencies by calling 520-965-5965, and security forces related incidents, call 520-909-8476.

- **Medical Facility / Treatment:** NON-EMERGENCIES:
1) 355 MDG (base clinic & after-hours nurse), Bldg 400, DMAFB AZ, 520-228-2778;
2) Health and Wellness Center (HAWC), Bldg 4220, DMAFB AZ, 520-228-2294

LOCAL AREA HOSPITALS:

- 1) St. Joseph's Hospital, 350 N. Wilmot Rd., Tucson AZ 85711, 520-873-3000;
 - 2) St. Mary's Hospital, 1601 W. St. Mary's Rd., Tucson AZ 85745, 520-872-2254;
 - 3) Banner UMC (Main), 1501 N. Campbell Ave., Tucson AZ 85724, 520-594-0111;
 - 4) Southern AZ VA HCS, 3601 S. 6th Ave., Tucson AZ 85723, 520-792-1450;
 - 5) Tucson Medical Center, 5301 E. Grant Rd., Tucson AZ 85712, 520-327-5461;
 - 6) NW Medical Center; 6200 N. La Cholla Blvd., Tucson AZ 85741, 520-742-9000
- **Evacuation / Muster Point:** The GATHERING POINT for 943 MXS building 1750 is the parking lot on the SE corner of Arizola Street and First Street. From the hangar, exit the West hangar door and head East around the building towards the parking lot. From room 139, exit the South exterior door and head East towards the parking lot.

The GATHERING POINT for 943 MXS building 1632 is the parking lot on the SE corner of Arizola Street and First Street. From the Propulsion and AGE bay/interior offices, exit the closest East exterior door and head West around the building towards the parking lot.

- **Shelter in Place:** Bldg 1750, Rooms 138 and 137
- **Active Shooter Response Methods:** All personnel must quickly determine the most reasonable way to protect themselves from the shooter and escape, hide out, and/or act against the shooter.

The installation Giant Voice will announce three times "LOCKDOWN, LOCKDOWN, LOCKDOWN, the last known threat area is (Affected Area)." The Installation mass communication system will be used to alert personnel of an active shooter incident. All personnel must quickly determine the most reasonable way to protect themselves from the shooter and escape, hide out, and/or take action against the shooter. Personnel in the immediate area of the shooter will:

ESCAPE: Evacuate if possible. Identify an escape route beforehand. If an escape path is available, evacuate the premises. If in a customer service area, remember, customers will follow the lead of office personnel during an active shooter situation. While moving, personnel should alert others of the incident by shouting "LOCKDOWN, LOCKDOWN, LOCKDOWN."

- Evacuate whether others agree to follow or not.
- Leave belongings behind.

- Help others evacuate if possible.
- Prevent others from entering an area where the shooter may be located.
- Keep your hands visible.
- Follow the instructions of Security Forces when encountered.
- DO NOT attempt to move wounded personnel.
- Call 911 when safe to do so.
- If in a group, chose one person to call 9-1-1 and follow the directions of the 9-1-1 operator.
- Call only if you have pertinent information, to ensure lockdown procedures are initiated, to alert first responders and/or to provide current/ updated information regarding the threat.
- Pertinent information includes: incident/shooter location, number of shooters, number and type of weapon (handgun, shotgun, rifle, automatic weapon), shooter's physical description and direction of travel, number of casualties, explosive devices, chained doors, etc.
- Do not assume others have alerted 9-1-1 operators until that action is confirmed by the activation of mass notification systems (Giant Voice, etc.).
- If you are connected to the 9-1-1 operator, stay on the phone and answer all questions. Do not hang up until told to by the controller/operator.

HIDE OUT:

- If evacuation isn't possible, personnel in the immediate area must find a place to hide where they are less likely to be discovered by the shooter. Take immediate cover to minimize exposure. Move quickly away from the threat and seek shelter inside the nearest room/building which can be locked. Relocate as many personnel from hallways and common areas to an area which can be secured and locked. While moving, personnel should alert others of the incident by shouting "LOCKDOWN, LOCKDOWN, LOCKDOWN."

The hiding place should:

- Be out of the shooter's view.
- Provide protection if shots are fired.
- Be in an area that doesn't trap or restrict options for movement if possible.

To prevent the shooter from entering the hiding place:

- Lock the door.
- Blockade the door with heavy furniture, if available.
- Turn off the lights.

If the shooter is nearby, personnel must:

- Silence cell phones.
- Turn off any source of noise (i.e. Television or radio).
- Hide behind large items if possible. If not, lie flat on the floor.
- Stay clear of windows and doors.
- Remain quiet.

Take action against the shooter:

- This is used as a last resort if the opportunity presents itself and only when your life is in danger.
- Personnel should use whatever means possible to overpower the subject to save further lives.
- Use the minimum force necessary to subdue the threat, however, deadly force is authorized when an individual reasonably believes he/she, or others in the area, is/are in immediate danger of death or serious bodily harm.

- **Adverse Weather Shelter:** Bldg 1750, Room 138

No evacuation route image uploaded.

Emergency Equipment and Safety Board

Safety Bulletin Board Location: Bldg 1750 first floor main hallway and room 138 along the North wall.
Bldg 1632 in the engine maintenance bay along the West wall.

List fire pull stations, extinguishers, power cutoffs, eyewash stations, AEDs, foam systems, and any local fire/emergency equipment notes.

No emergency equipment maps or location photos uploaded.

Traffic Safety Program

DAF Traffic Safety Program (DAFI 91-207): Train personnel on mandatory use of seat belts and helmets, speed limits, local traffic hazards, spotters while backing, vehicle training requirements, and restrictions on electronic device use while operating vehicles on- or off-base.

Seat Belts / Occupant Restraints: All persons operating or riding in motor vehicles must wear installed restraint systems as prescribed by the manufacturer. Drivers are responsible for ensuring all passengers are briefed on and use required restraints.

Motorcycle / ATV Training: Personnel must complete required safety training before riding a motorcycle, and local units should address required PPE, licensing, refresher training, and safety representative contacts.

Pedestrian / Bicycle Awareness: Emphasize local roadway crossing hazards, visibility requirements, spotter use, and other pedestrian or bicycle precautions specific to the installation.

Local Traffic Hazards / Vehicle Notes:

LOCAL TRAFFIC HAZARDS:

- Poor road quality i.e., potholes, loose or uneven shoulders: Be aware of surface conditions and take added caution in areas of road construction. Move to the opposite lane when you encounter vehicles stopped on the side of the road i.e., Arizona State law requires the driver to move to the left lane when encountering an emergency vehicle on the right shoulder, if unable to move over then driver will slow down and move to the left most part of the lane, passing with extreme caution.

- Weather conditions: Low lying roadways are prone to flooding and this area is subject to flash floods. Slow down at night! With limited sight distance, comes limited reaction time. Expect icy conditions on bridges, overpasses, and shaded areas during colder months when it rains, snow or freezes happen. Dust storms do occur at times in Tucson and in between Tucson and Phoenix. If you are caught in a dust storm and are able to pull to the side of the road turn off your lights, set park brake and keep foot off of brake. If unable to pull off to the side of the road, reduce speed and proceed with caution.

- Animal/Object Strikes: Coyotes and Javelina are mostly the largest animals you will encounter crossing roadways in the Tucson area. In the outer parts of Tucson the roads go through open ranges which are where you may encounter a cow along the side of the road or in the road. If you see a coyote or Javelina or other large animal, SLOW DOWN and attempt to drive by the animal in a controlled manner. Attempting to steer around objects at high speed causes many other issues that can cause the driver to lose control i.e., running off the roadway, uncontrolled spin, roll over.

SPOTTERS: Are required when operator visibility is obscured or in question, when backing a vehicle, and prior to beginning aircraft up/downloading (with pre-positioned chock in place).

Backing of government-owned motor vehicles and the usage of spotters will be IAW AFMAN 24-306.

- Spotter(s) will use a reflective belt and flashlight or luminous wand during hours of darkness or periods of reduced visibility: Reflective belt and flashlight or luminous wand.

- Spotter(s) must be trained in standard hand and arm signals and flashlight signals before guiding a vehicle.

- Spotter(s) will position themselves away from the vehicle's path of travel and maintain visual contact with the vehicle operator.

- Government-owned motor vehicle operators will immediately stop if they lose visual contact with

the spotter or notice the spotter is dangerously positioned between the vehicle and another object. In such cases, vehicle operators will secure the vehicle, exit and make an on-the-spot correction before continuing operations.

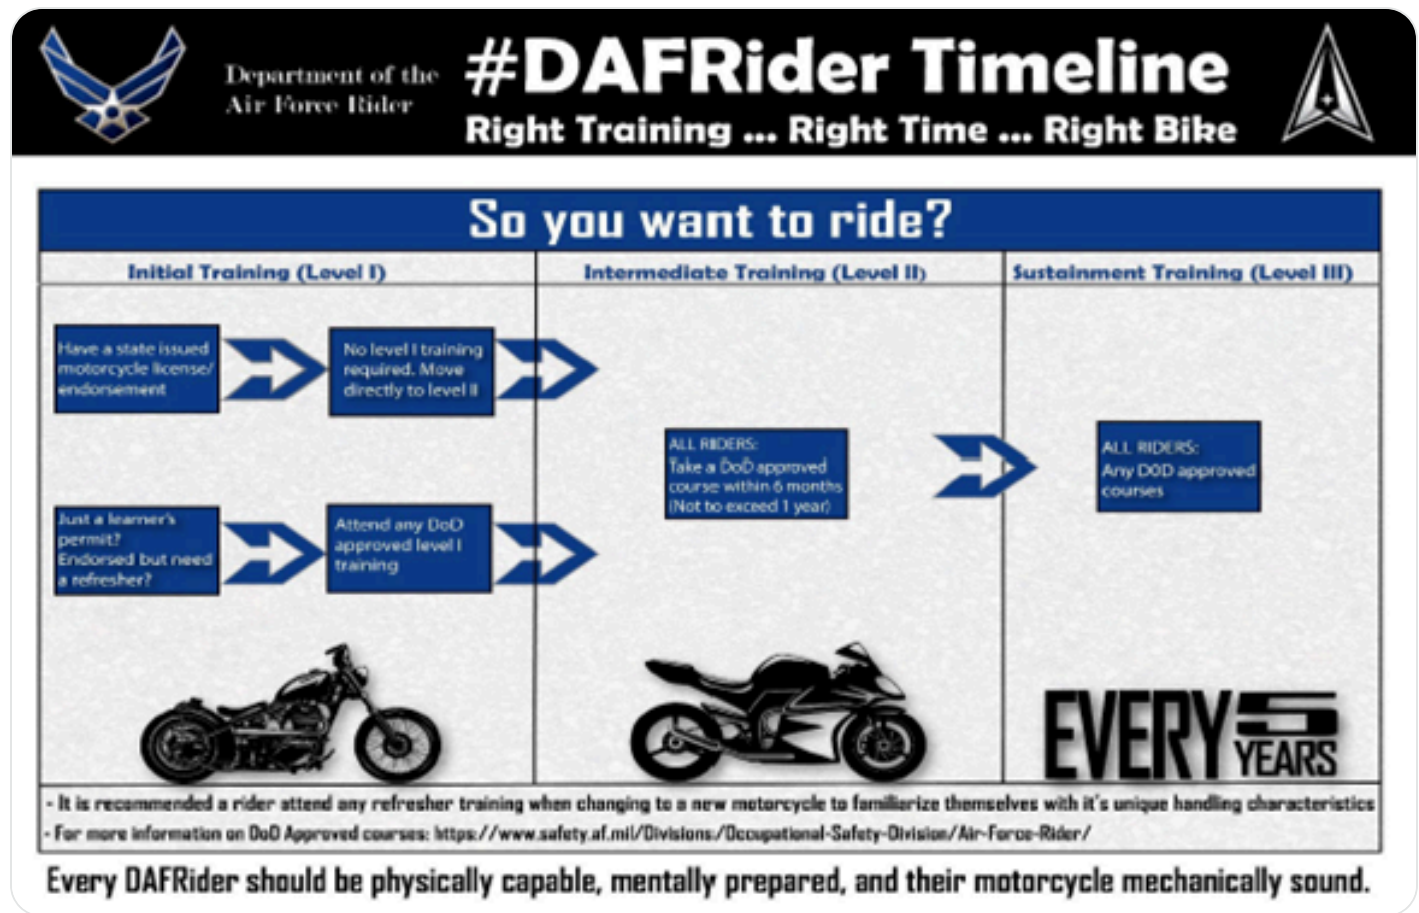

LICENSING/TRAINING REQUIREMENTS: A state driver's license is required to operate any vehicle. Additional training is dependent on duties/responsibilities.

- Certificate of Competency required for all flightline driving and operation must be IAW AFI 13-213.
- Before operating a Polaris Ranger/Razor, utility vehicle and other similar vehicles, personnel must complete LSV/OGMV training.

USE OF ELECTRONIC DEVICES: Unless a hands-free device is used, use of cell phone is prohibited while operating a vehicle on base. Federal employees shall not engage in text messaging (a) when driving GMV, or when driving PMV while on official Government business, or (b) when using electronic equipment supplied by the Government while driving. Arizona law prohibits drivers from using a cellphone or a stand-alone electronic device while driving unless it is being used in a hands-free mode. This includes, but is not limited to, cell phones, tablets, and music & gaming devices.

No routine-use GVO risk assessment files uploaded.

Reporting Unsafe Equipment, Conditions, or Procedures

Notify the supervisor immediately when unsafe equipment, conditions, or procedures are identified. Personnel may report hazards without fear of retaliation, coercion, discrimination, or reprisal.

- **DAF Form 457:** Use to document and elevate unsafe conditions, equipment, or processes.

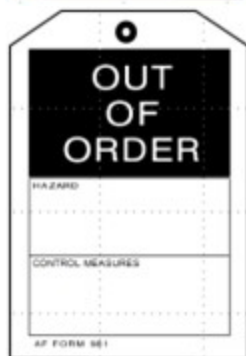

- **SAFEREP:** Use the approved mishap or hazard reporting channel for additional reporting when directed by local procedures.

A white tag with a black top section containing a red oval with the word "DANGER" in white. Below this is a white section with the label "HAZARD" and a larger white section with the label "CONTROL MEASURES". The tag has a hole punch at the top and is marked "AF FORM 979" at the bottom.

A yellow tag with a black top section containing the word "CAUTION" in yellow. Below this is a yellow section with the label "HAZARD" and a larger yellow section with the label "CONTROL MEASURES". The tag has a hole punch at the top and is marked "AF FORM 980" at the bottom.
